Getting Started with Hello World

Introduction

Dart is an open-source programming language originally developed by Google. It is meant for both the server side as well as the user side. The Dart SDK comes with its compiler – the Dart VM and a utility dart2js which is meant for generating the Javascript equivalent of a Dart Script so that it can be run on those sites also which don't support Dart.

Hello World Program in Dart Programming Language

In dart main() function is a predefined method and acts as the entry point to the application. A dart script needs the main() method for execution of the code. The program code goes like this:

```
main() {
  print("Hello World! Hello Flutter");
}
```

Output:

```
Hello World! Hello Flutter
```

The Explaination of the Program is mentioned below:

main(): *it is the symbol of main function that means the data entered in it is directly executed by compiler.*

print("Hello World!") *: the role of print function is quite simple it just prints the data during the compilation of a program.*
